Sellers grab Dubai by the horns!

Le Totsa Taureau says "Sacré bleu!" as the physical premium is eviscerated. Exxon was leading the charge. We've been thinking the physical premium for Dubai was disproportionately strong given the weak fundamental picture in Asia. And today we saw that differentials collapse. Those betting physical Dubai would keep up its momentum have seen those hopes go down the drain. The physical premium tumbled by 39c all the way down to \$1.14 – that's the lowest we've seen since 27 August!

Over the past couple of days, according to trading sources, many Chinese corporates and small entities, from Unipec to banks, have been selling the Nov/Dec Dubai swap spread. Either they know something, or they are just getting ahead of the softening demand and are selling before someone else does. The spread came down from 29c to 23c. The spread was 47c last Friday. The Asian macros are so negative, traders have been expecting a dump for some time but the bulls always managed to skewer the shorts. But it seems the tide finally turned. Is the strength in Dubai physical premium, that we've seen since June, finally over?

The window showed Chevron continuing its sniping tactics from yesterday, picking off low bids wherever they cropped up. Reliance and Exxon joined Chevron on the sellside, beating down on the buyers again. Sellers relentlessly hit standing bids by Totsa and Repsol as the window came to a close and finally in the last few seconds the two bidders turned aggressors and lifted a few offers from Exxon. But the values contracted heavily.

The Middle East isn't simply a trilateral issue between US/Israel and Iran as the potential for a spillover remains very high as we've been reminded yesterday. A terror attack at an aerospace firm in Turkey with a minimum of five killed, and allegedly carried out by Kurdish rebels.

The Benchmark Publication

In detail

Another day, another dump. Do not forget and focus please on what the return of OPEC barrels means! The Saudis and friends are coming back to give you more in December, which means some markets are gonna come down! "That's the plan" said a Saudi source close to the matter. Some benchmarks lost almost two dollars against the Asian close yesterday. Dubai physical took the biggest hit of the three, down \$1.85/bbl to \$73.55/bbl. The physical premium got absolutely battered, down to \$1.14, a 39c drop! That's the biggest daily change to the premium (excluding rolls) since the madness of 5 August. Send thoughts and prayers to Totsa...and whoever was long Dubai hoping for some Israeli action. Meanwhile, Dec Brent fell to \$74.35/bbl, a loss of \$1.68/bbl. This saw Dec Brent futures' premium over Dubai partials surge to 80c, from 63c yesterday.

Refining margins have suffered globally with 321 cracks stubbornly remaining around their lowest point since 2021, as weak product demand has largely failed to pass through to the underlying crude price for many reasons we discuss in our reports. And refiners are getting whacked as a consequence. We mentioned Equinor's weaker Q3 profits yesterday, but they've been vastly overshadowed by US refiner Valero's collapsing profits: in Q3 operating income was almost 86% down y/y. No wonder Valero said it may shut its California refineries... rather concerning for a refining big boy with total throughput of over 3 mb/d spread between refineries in the US, Canda and the UK. California taxes them too much plus they fine them, so what does the state expect? Eni also posted significantly lower earnings last night, with Q3 net profit down 30% y/y. This still wasn't dreadful enough to underwhelm the market's expectations - the company's share price opened 1% higher this morning. It shows how pessimistic the financial consensus is when a 30% decline in profits beats expectations.

Look no further than aviation fuel cracks for evidence of the weak margins. The NWE Jet crack deteriorated from above \$45/bbl last August to the low \$16/bbl range today. Similarly, the Singaporean equivalent has fallen from around \$37/bbl in August last year to around \$14/bbl today. Demand for jet fuel is simply awful. From our observations, flights are running empty too. This is hurting airline profitability. Look no further than American Airlines' quarterly financial results, published yesterday: this quarter saw a \$149 million loss in net income. It's a less terrible result than Q3 last year, an abysmal, with a \$545 million loss.

There's another big problem for airlines. It's called Russia. Going around is inconvenient and expensive. No wonder numerous airlines that can no longer travel through its airspace are cutting flights between China and Europe; they can't compete with others that can still traverse the airspace of the world's biggest country. Speaking of cancelled flights, we've seen airlines cancelling operations in the Middle East due to the dangers of flying in the region. The likes of Delta Air, Cathay Pacific and EasyJet have all suspended flights to and from Israeli airports until at least March – until next October for Cathay Pacific. Sadly, the only jets wanting more fuel seem to be military ones. See why we're not optimistic for jet fuel demand?

It's not looking great for China either. It's no secret that local governments in China have a serious debt serviceability problem. They borrowed huge amounts for infrastructure projects, with current estimates of total sector outstanding debt at around \$800bn. They assumed growth would follow, and thus projects would finance themselves. The financial sector helped, packaging debt in local government financing vehicles (LGFV).

But the growth didn't really happen. Since COVID, China has failed to get back on its feet, despite the PBoC cutting rates. Since 2019, the Loan Prime Rate has fallen from 4.3% to 3.1% in the same time. You'd have thought this might help the heavily indebted local governments, enabling debt rollover at more lower yields... in theory. But, in the same period, government debts (local and central) have risen by around 50%. Defaults of hidden debt tied to LGFVs have jumped 20% since this time last year, according to Financial China Information & Technology Co. In 2024, Chinese public debt is expected to total around 164 trillion yuan, according to the IMF, including 66 trillion LGFV debt, almost double that of the central government. Don't be optimistic for a turnaround either: the IMF expects Chinese gross government debt to exceed 100% of GDP by 2027, from just over 90% in 2024. The deterioration of the debt landscape will only delay any material recovery in Chinese domestic demand. With EV penetration growing, weak aggregate demand and troubling debt, oil demand prospects for the second biggest consumer keep worsening.
